

# Formulation and Evaluation of an In Situ Gel for Ocular Delivery

Norfloxacin ophthalmic solution has been shown to be effective ocular infections and may be used in patients with chronic conjunctivitis or ocular irritation. Norfloxacin in-situ gel was prepared using various concentrations of polymers such as Carbopol-940 (0., 0.2, 0.3 0.4 and 0.5% w/v), HPMC- E50LV (1.5 % w/v), HPMC E4M (0.6 %w/v) and HPMC K4M (0.5% w/v) by pH triggered gelling system with an objectives of increasing contact time, achieving controlled release, reduction in frequency of administration and greater therapeutic efficacy of drug. The prepared in-situ gels were then evaluated for their visual appearance, clarity, pH, drug content analysis, in-vitro gelation (Gelling capacity), rheological studies, sterility testing, texture analysis and in-vitro drug release studies. It is evident from these studies that, formed polymeric in-situ gels had transparent, clear possessing satisfactory gelling capacity. The developed formulation was light yellow in colour, therapeutically efficacious, stable, non irritant with sustained release of drug.
